Reflective Journal

Finishing this lab helped understand data science a bit more. It showed me that it's more than writing codes and that tools like NumPy and pandas are helpful to people that work with data. At first a lot of this was confusing because I'm new to using these tools. I learned that NumPy can work with numbers a lot faster and makes code simpler.

In my opinion I think making graphs helps me understand the data better. The scatter plot showed a good visual of the flowers were alike in some ways and different in others. The bar graph helped me understand the number of samples from each flower. Being a visual learner, this helped me a lot personally.

One challenge I think I would have is making sure the cells were ran in the correct order. If something was missing, the code wouldn't run properly. It would be solved by re-checking my codes and rerunning the cells when needed.

This lab did help me become more familiar with using these programs, even though I definitely need a lot more practice.
