Reflective Journal L03 Lab

In this lab I got to better understand the machine learning process. I'm new to most of this so it was a little difficult to follow along. Once I started going over the content multiple times it started making a little more sense. I learned about supervised, unsupervised and reinforcement learning and the differences between them. In supervised learning it uses data that has the correct answers already to teach the model. With unsupervised learning it tries to find patterns in the data without having the correct answers. And in reinforcement learning when it makes good choices it gets rewards. Going in depth helped me learn about the different types of machine learning.

Going over the wine project helped me see that some models perform better than others. In this specific logistic regression came out with the highest accuracy, which shows how important it is to choose the right model to improve predictions. One of the hardest parts of the lab for me was understanding the results and comparing them. I had to review the accuracy scores a couple of times for it to make sense to me. But after I was more understanding of how the results helped decide which model is best to use.

Overall, the lab helped me get a better understanding of machine learning and how it actually works. I learned how models use data in different ways to make predictions. I also learned how machine learning is used in different ways in real life. Like transportation,
